Maximum Marks	

Project Overview

- **Project Name:** SpendWise
- **Project Description: SpendWise is a backend application developed using Node.js,**
  Express.js, and MongoDB. This project allows users to register and log in to the system. After logging in, users receive a JWT (JSON Web Token) which is used to access secure APIs.The application enables users to manage their personal data by performing CRUD operations (Create, Read, Update, and Delete). All data is stored in a MongoDB database, and authentication is implemented to ensure that only authorized users can access the protected routes.

Testing Scope

Features and Functionalities to be Tested

- **User Registration API**
- **User Login API (JWT Token Generation)**
- **JWT Authentication and Protected Routes**
- **Create Data (CRUD Operation)**
- **Read Data (CRUD Operation)**
- **Update Data (CRUD Operation)**
- **Delete Data (CRUD Operation)**
- **MongoDB Database Integration**
- **Error Handling and Validation**
- **Unauthorized Access Protection**

User Stories or Requirements to be Tested

- **User can register an account using name, email, and password.**
- **User can log in using valid email and password.**
- **User receives a JWT token after successful login.**
- **User can access protected APIs using the JWT token.**
- **User can create their own records or data.**
- **User can view only their own records.**
- **User can update their existing records.**
- **User can delete their own records.**
- **User cannot access protected APIs without authentication.**
- **Unauthorized users are restricted from accessing other users' data.**

Test Cases

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Create Account	1. Send POST request to /api/users/register with user details	New account should be created	Account created successfully	Pass
TC-002	User Authentication	1. Send POST request to /api/users/login with correct email and password	Authentication token should be generated	Token generated	Pass
TC-003	Verify Secure Route	1. Send request with valid authentication token	System should allow access to protected route	Access allowed	pass
TC-004	Add New Data	1. Send POST request with user token and data	Data should be stored in database	Data stored successfully	Pass
TC-005	View Data	1. Send GET request with authentication token	User data should be displayed	Data displayed	Pass
TC-006	Modify Data	1. Send PUT request with updated information	Existing data should be modified	Data modified	Pass

TC-007	Remove Data	1. Send DELETE request with authentication token	Data should be removed from database	Data removed	Pass
TC-008	Access Without Login	1. Send request without authentication token	System should block access	Access blocked	Pass

SIGN-OFF

Testing Date: Feb 2026

Notes

- **All test cases were executed successfully during the testing period.**
- **Both positive and negative test scenarios were verified.**
- **Authentication and security features were tested properly.**
- **CRUD operations (Create, Read, Update, Delete) worked as expected.**
- **No major bugs were identified during testing.**
- **The system is functioning correctly and ready for project submission.**
